

Annual Review for LF energy CoMPAS

Project is maturing
9 June 2026

LFENERGY

Brief Description:

CoMPAS offers common software blocks for IEC 61850 profile configuration, using an open source shared development model, accelerating conformity to IEC 61850 interoperability requirements through software implementation.

Primary use cases:

- Tools for IEC 61850 profile management and configuration are needed at various business processes of the power grid industry
- The planning process for grid infrastructure components facilitates the design of power system adaptations and the engineering of substation PACS to be installed or upgraded
- Specifying requirements and performing multi-vendor system integration and commissioning during the PACS procurement and delivery phase
- Adapting to changes in operational conditions and performing system configuration updates during the operational life of PACS
- Managing assets in order to perform maintenance actions and PACS upgrades
- Improving the interlinkage between grid planning and PACS engineering processes
- Improving the interlinkage between the configuration of PACS and the configuration of central systems, including SCADA and asset management

Agenda

- Current community
- Key achievements last year
- Key goals for coming year
- Growth plan
- Ready for next step in the project Life Cycle: Incubation → Early Adoption - vote
- Areas the project could use help
- Feedback on working with LFE

Key Achievements in the past year

- Community growth: SprintEins and Axp0 joined the CoMPAS TSC plus several vendors, DSO and independent training academy requested introduction
- Technical improvements: update libraires
- LFE Summit Presentations 2025 & 2026, Webinar on engineering, Meetup 2025 & 2026
- First productive distribution at TSO
- More collaboration between community members

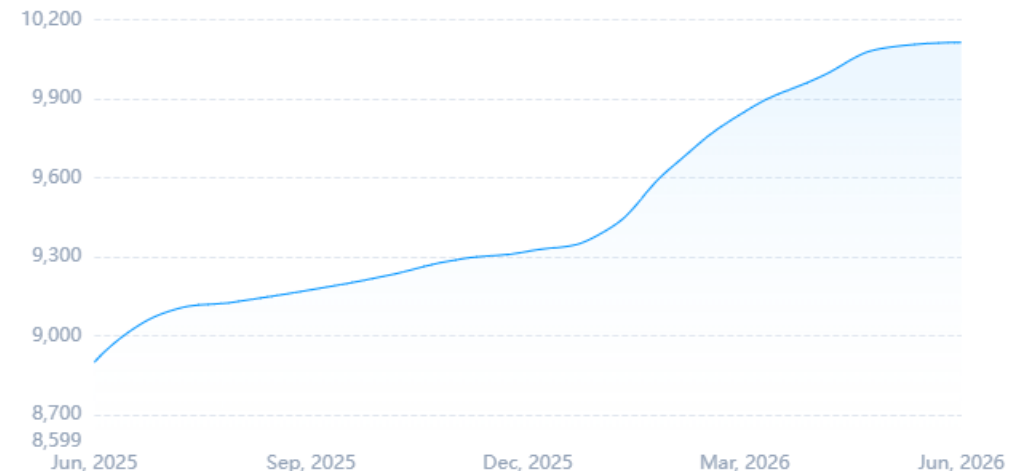

Commit Activities

Number of commits performed during the selected period. [Learn more](#)

1,294 ⬆ 65.7% (+513)
vs. 781 last period

New

Cumulative

Contributions

★ Due to its modular approach there are more contributors and companies than LFX indicates

LFENERGY

Contributions

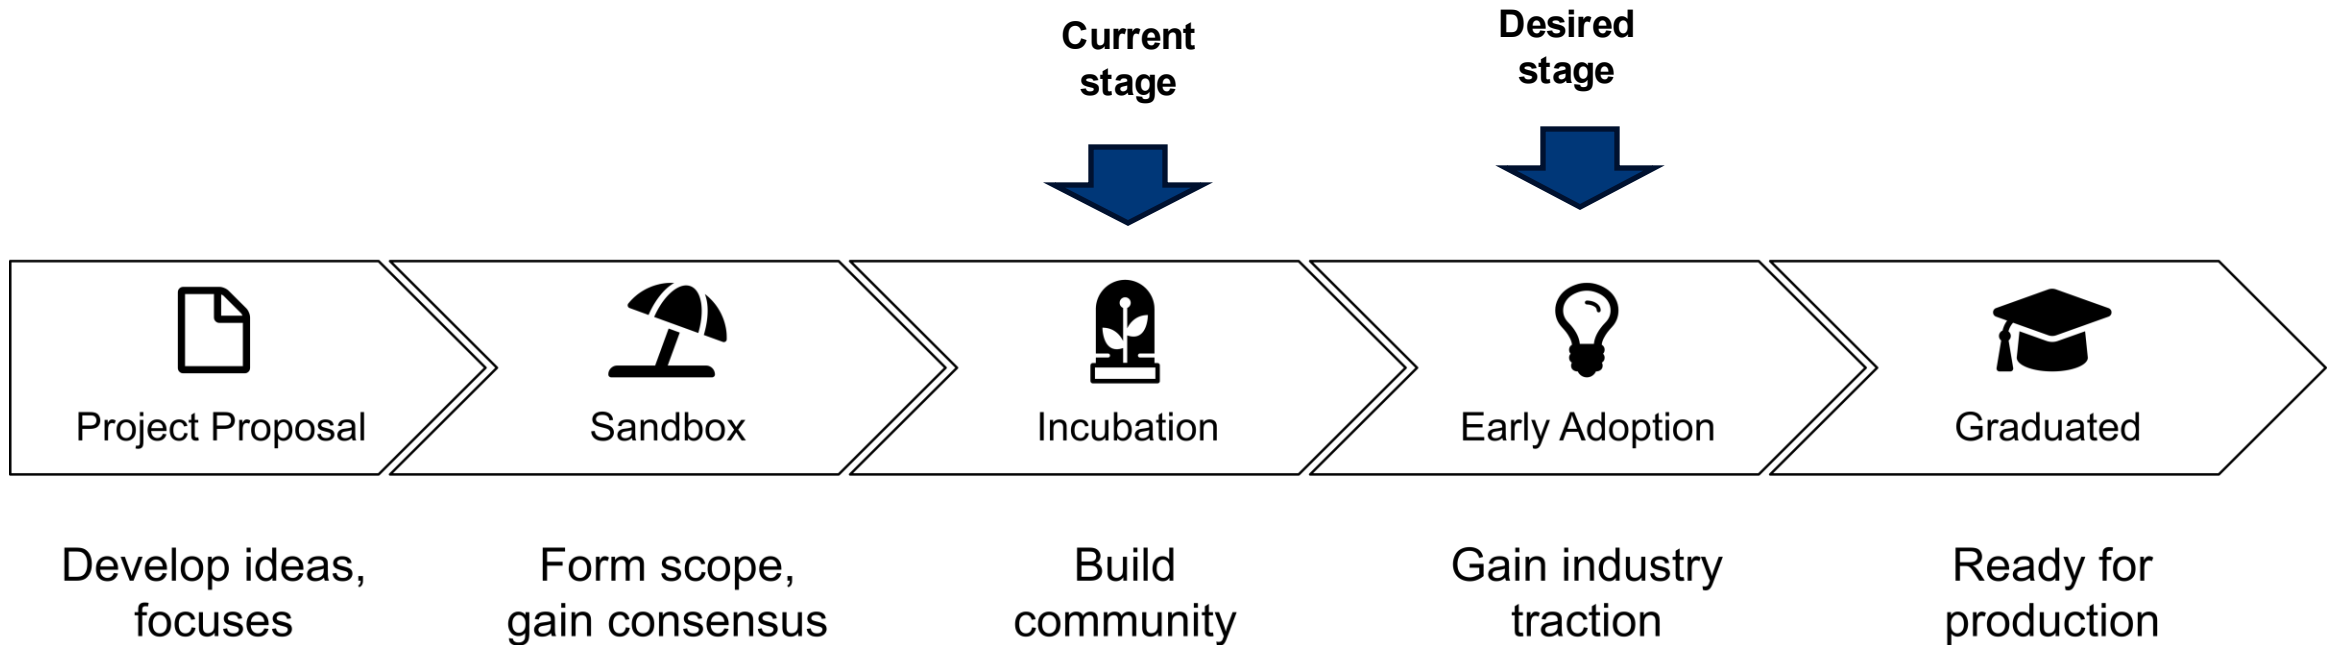

- Community perspective: With growing momentum, a “quality seal” would be highly appreciated, many potential user/organisations seek confirmed maturity of CoMPAS

Great meetup in Aachen!

Ambition for today: We would like to apply for the early adoption stage!

Growth Plan to Scale the Community

We have the following ambitions:

- Increase contributions by motivating recurring contributions from organizations that use or extend CoMPAS
 - Contributor recognition
 - Active support for contributors
- Attract new contributors
 - Increase contribution backlog exposure + “good first issue”
 - Improve documentation by making contribution guides easy to navigate.
- Expand Outreach
 - Social media presence (e.g LinkedIn)
 - Event presence (e.g. FOSDEM, LF Energy Summit, etc.)
 - Webinars
 - Present it to ENTSO-E

Early Adoption Project review criteria

To be considered for the Early Adoption Stage, the project must meet the following requirements:

- Demonstrate growth in the project's community, including
 - Growth in the number of commits to the project, number of project committers, and organizational diversity of contributions and committers. ✓
 - Production or planned production use of the project by at least two independent end users which, in the TAC's judgment, are of adequate quality and scope. ✓
- Technical Governance of the project is operational, as measured by:
 - A Technical Steering Committee with at least 5 members and a chairperson elected by the members, holding regular open meetings ([aligns with OpenSSF Best Practices Gold badge requirement](#)) ✓
 - Achievement of the OpenSSF Best Practice badge at the '[Silver](#)' Level  98%
- Development of a growth plan, to be done in conjunction with their project mentor(s) at the TAC. This plan should address the following points:
 - Release plans for the next 18 months. ✓
 - Target end-users. ✓
 - Identification of any regulatory or standards body requirements for deployment, and plans for implementation. ✓ (not applicable)
 - Plans for growth of project contributors and committers to support the growth plan. ✓
 - Identification of any infrastructure resources needed to fulfill the growth plan. ✓

Point of attention

- One point of the silver level is not reached, this will be done soon with help of OSTIF.

☐ Met
☒ Unmet
☐ ?

The project MUST provide an assurance case that justifies why its security requirements are met. The assurance case MUST include: a description of the threat model, clear identification of trust boundaries, an argument that secure design principles have been applied, and an argument that common implementation security weaknesses have been countered. (URL required)
[assurance_case] [Show details](#)

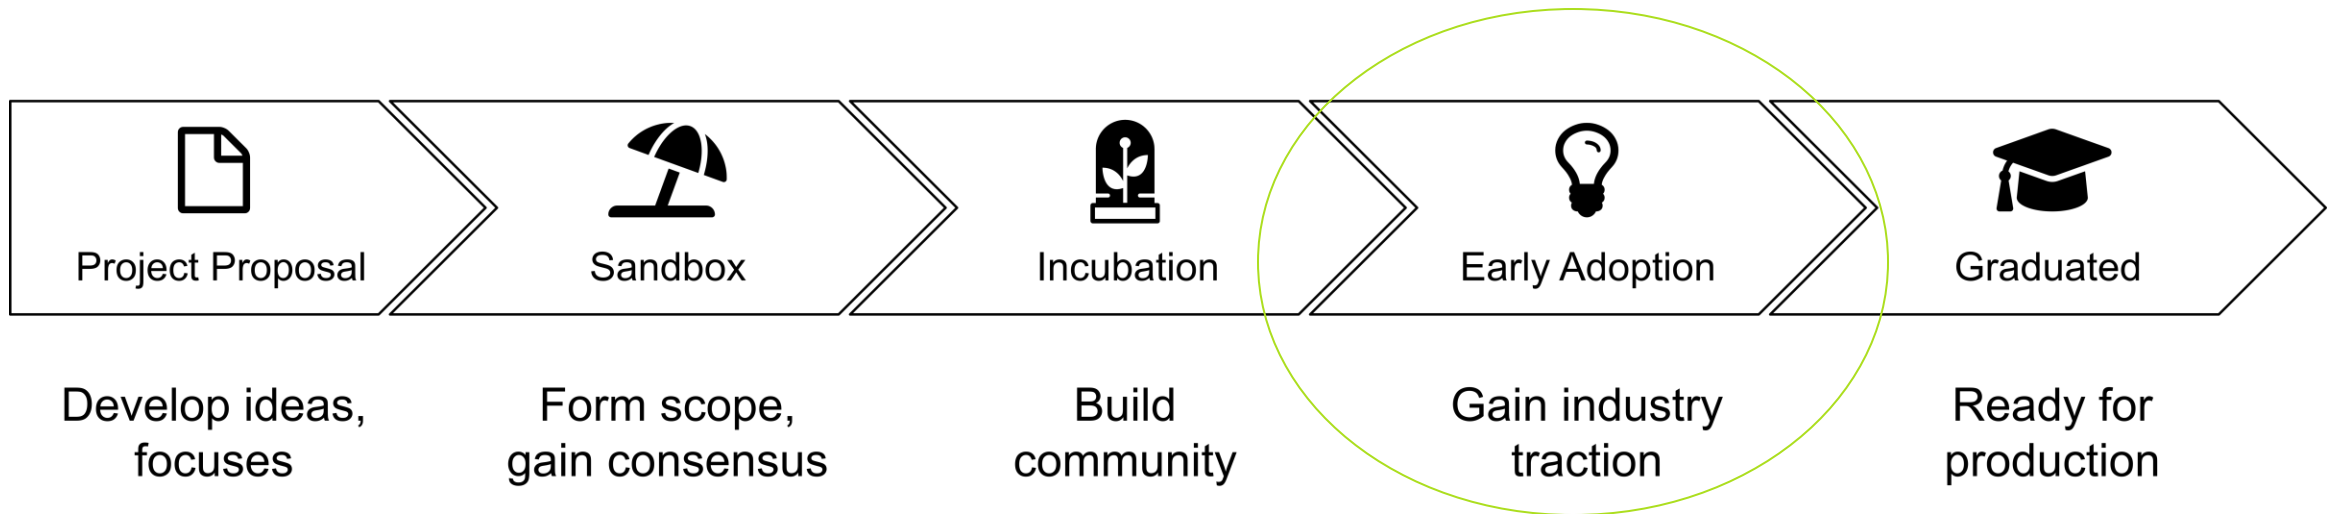

To do (see issue <https://github.com/com-pas/compas-architecture/issues/163>); OSTIF will help us here.

▼ Analysis

2/2 ●

Early adoption vote

Approval to move CoMPAS automatically to the Early Adoption stage upon achieving the OpenSSF Best Practices Silver badge and the completion of a Security Threat Model Assessment to further strengthen the project's security posture.

Areas the project could use help on

Spread the word!

Feedback on working with LF Energy

LF Energy Summit: unsure if the all-male panel rule has the desired effect

Outlook

- More utilities showing interest
 - Strong interest from relevant vendors
 - More use foreseen
-
- CoMPAS meetup! Day before the LF energy summit in Berlin!
